Problem Statements

Your team will be assigned one of the following problem statements. Build a product that solves the problem while creating at least three separable modules that can be sold independently.

1. Smart Campus Emergency Response

Develop a campus emergency-response platform that helps students and staff report incidents such as medical emergencies, fire hazards, harassment, unsafe areas, or infrastructure failures. The system should help authorities identify the incident location, prioritize the case, notify appropriate responders, and track resolution.

Suggested Modules

- Emergency reporting with category, description, image, and location
- Live incident map with severity levels
- Responder assignment and status tracking
- Anonymous reporting and evidence protection
- Broadcast alerts to nearby campus users
- Analytics dashboard showing repeated incidents and response time

2. Community Healthcare Companion

Build a digital platform for patients in semi-urban or rural communities who need help managing appointments, prescriptions, medical reports, follow-ups, and communication with healthcare workers. The system should assist patients without presenting itself as a replacement for a doctor.

Suggested Modules

- Patient profile and medical-record timeline
- Prescription and medication reminder system
- Appointment booking and queue management
- Offline-first access for low-connectivity areas
- Health-worker dashboard
- Emergency contact and escalation mechanism
- Regional-language interface

3. Intelligent Waste Collection Network

Develop a waste-management platform for residential areas or campuses that helps users report overflowing bins, guides collection workers, and enables administrators to optimize collection routes and monitor segregation performance.

Suggested Modules

- Bin reporting with image and location
- Waste-category recognition using rules or machine learning
- Collection-worker task dashboard
- Route planning and prioritization
- Pickup status and notification system
- Area-wise waste analytics

4. Farmer-to-Market Decision Platform

Create a platform that helps small farmers decide what, when, and where to sell their produce. The product should combine crop information, local demand, weather-related risks, transportation availability, and buyer communication using mock or publicly available datasets.

Suggested Modules

- Crop and harvest planning assistant
- Local price and demand dashboard
- Weather-risk alerts
- Farmer-buyer communication
- Aggregated transport or pickup scheduling
- Produce quality and inventory records
- Regional-language and voice-assisted interface

5. Accessible Public Transport Assistant

Build an application that helps users plan safer and more accessible journeys using buses, shared transport, or campus vehicles. It should support users with disabilities, elderly passengers, or people travelling during late hours.

Suggested Modules

- Route and stop discovery
- Accessible-route planning
- Crowding, delay, or availability reporting
- Safety check-in and emergency contact
- Arrival and route-change notifications
- Driver or operator dashboard
- Offline route information

6. Student Skill and Opportunity Exchange

Develop a platform where students can exchange skills, find project collaborators, discover internships or competitions, and form teams based on interests, availability, and complementary abilities.

Suggested Modules

- Verified student profiles
- Skill matching and recommendation engine
- Project or opportunity listings
- Team formation and role management
- Portfolio and evidence upload
- Peer endorsement system
- Messaging and scheduling

7. Smart Energy Monitor for Hostels and Homes

Create a system that helps hostels, apartments, or small businesses monitor electricity usage, detect unusual consumption, and encourage energy-saving behavior. Hardware may be simulated through APIs, sample datasets, or a simple mock sensor layer.

Suggested Modules

- Real-time or simulated energy dashboard
- Room-wise or device-wise consumption tracking
- Abnormal-usage detection
- Cost estimation and bill projection
- Energy-saving recommendations
- Admin dashboard and comparative rankings

8. The Shopkeeper's Day

Help someone run a small retail shop — stock, credit ledger, billing, supplier ordering. Small shopkeepers often manage inventory, customer credit, billing, and supplier orders using paper or fragmented apps. This challenge combines ledger management, inventory tracking, OCR for bills, and offline-first operation for areas with poor connectivity.

Suggested Modules

- Khata / Ledger engine
- Catalogue + inventory
- Bill OCR
- Low-connectivity sync
- Supplier ordering workflow
- Sales analytics dashboard

9. Getting Paid

Helps an independent worker — tailor, electrician, tutor, freelancer — quote, invoice, chase dues and track income. Independent workers often struggle with professional invoicing, tracking payments, and following up on dues. This product helps them appear more professional, get paid faster, and understand their income patterns without needing accounting expertise.

Suggested Modules

- Invoicing module
- Dues reminders over WhatsApp or SMS
- UPI reconciliation
- Income analytics
- Quote generation
- Client management

10. Paperwork & Access

Makes government schemes, documents, forms or claims navigable for people who find them opaque. Government forms and schemes are often difficult to understand, especially for people with limited digital literacy or those who do not speak the primary language. This challenge focuses on OCR, rules-based eligibility, autofill, and vernacular explanations to make essential services accessible.

Suggested Modules

- Document OCR + field extraction
- Eligibility rules engine
- Form autofill
- Vernacular explainer
- Application status tracker
- Document vault with reminders
